Team Size: [enter team size]

Problem Statement: Job seekers repeat search, resume tailoring, and tracking for every opening, and generic AI shortcuts fabricate experience they cannot defend.

Problem Statement

01 SEARCH IS REPETITIVE

Listings live on job boards. A candidate re-runs the same searches every day, skims duplicates, and loses track of what they have already seen.

02 TAILORING IS SLOW

Each role needs a resume rewritten against its description and shaped to pass an applicant tracking system (ATS), usually by hand.

03 TOOLS FABRICATE

Generic AI resume tools raise keyword scores by inventing employers, metrics, and skills, leaving a document the candidate cannot defend in an interview.

Who feels it: mid-career technology professionals in India, and those targeting US roles, who apply every week and keep a master resume in a Google Doc.

The cost is not only time. It is applying to the wrong roles, or sending a resume that does not hold up.

Proposed Solution

CAREERPILOT AI: ONE SCHEDULED LOOP, RUN DAILY BY THE CANDIDATE'S OWN SETTINGS

Daily schedule
Runs only if left on

→

Find roles
LinkedIn query per target role

→

De-duplicate
Then cap to new jobs

→

Match gate
Scored vs. master resume; below the user's bar, stop

→

ATS resume
Fixed 8-section contract, validated

→

PDF
LaTeX compile, stored

→

Summary + board
Email, kanban to offer

FIXES REPETITIVE SEARCH

- Daily scheduled run per target role
- Duplicates removed before the cap is applied
- Kanban board from discovered to offer

FIXES SLOW TAILORING

- Match gate spends the rewrite only on jobs above the candidate's own score
- ATS-structured resume and PDF generated automatically
- Cover letter and interview prep in the same workspace

FIXES FABRICATION

- Prompt and validator share one contract
- Employers, dates, metrics, skills must trace to the source resume
- Candidate reviews every resume before anything is sent

Solution Architecture

CLIENT

- React + Vite SPA
- Job kanban
- Copilot chat

BACKEND (RUNNING TODAY)

- Supabase Auth
- PostgreSQL + RLS
- Storage
- Edge Functions

WORKFLOW ENGINE

- Run per role
- Step per job
- Step queue
- Match gate

GOOGLE AI AND SERVICES

- Gemini API: gemini-3.6-flash (+ fallback key)
- Google Docs / Drive
- Gmail (apply by email)
- Gemini Omni: resume / posting upload
- Gemini Live: interview practice
- Vertex AI + Cloud Run + Cloud Tasks + Scheduler

EXTERNAL DATA AND OUTPUT

- Apify (LinkedIn jobs)
- LaTeX compiler (PDF)
- Email summary
- Cloud SQL + Cloud Storage + Secret Manager + Firebase Hosting

☐ Built and running ⬚ Planned for the buildathon (Google Cloud migration path)

One run per target role, executed one at a time. Within a run, each job is its own step, so a long search never sits inside one request.

Google AI Tools

PLANNED

Google AI Studio

Design and evaluate the prompts behind each stage: match scoring, the ATS resume contract, cover letters, and interview briefs. Test them against real resumes before promoting them.

PLANNED

Google Antigravity

Build the scheduled agent steps during the buildathon: search, score, stop or tailor, PDF, and summary, with each step verifiable on its own.

PLANNED

Google Agent Skills

Package each stage as a reusable skill, so the loop can be extended per market, per role family, or per cohort of candidates.

Today: the product calls the Gemini API directly from Supabase Edge Functions. These three tools are the plan for the buildathon, not part of the current build.

Google AI Models

IN PRODUCTION

Gemini API

gemini-3.6-flash scores each job against the master resume, rewrites the resume into the ATS contract, drafts cover letters, and writes interview briefs. A second Gemini key is the automatic fallback.

PLANNED

Gemini Omni

Read an uploaded PDF resume or a screenshot of a job posting into the same master-resume corpus, so setup needs no retyping.

PLANNED

Gemini Live

Spoken interview rehearsal built on the brief the API already writes, with follow-up questions drawn from the candidate's real resume.

Why a Flash-class model: the match gate runs on every discovered job, and the rewrite runs only on jobs that pass it, so per-job cost stays low enough for a daily scheduled run.

Business Model, Competition and Markets

BUSINESS MODEL

- **Free:** manual search, small monthly quota of tailored resumes
- **Pro:** scheduled daily runs, more roles, ATS review, cover letters, interview prep, apply by email
- **Credits:** top-ups for heavy months
- **Teams:** per active candidate, for bootcamps and placement cells

COMPETITION

- **Teal, Simplify:** tracking and tailoring, triggered by hand
- **LazyApply, Sonara:** volume auto-apply, not defensibility
- **Jobscan, Rezi:** keyword scores, no discovery or tracking
- **Naukri, Instahyre:** discovery only
- **Us:** the whole loop, gated by match score, validated against the source

TARGET MARKETS

- **Primary: India.** India-based and India-remote roles
- **Secondary: United States,** already the default search location
- **Next:** United Kingdom, Canada, Singapore on the same English-language LinkedIn pipeline
