CareerPilot AI

Your job search, on autopilot. Your resume, still true.

An autonomous job-search workspace that finds matching roles every day, tailors a resume only from the candidate's real experience, and tracks every application to offer.

Event
Startup Buildathon India 2026

Category
AI for careers

Model
Gemini 3.6 Flash

PROBLEM STATEMENT

Job seekers redo the same manual work for every opening, every day.

01

Search is repetitive

Listings live on job boards. A candidate re-runs the same searches, skims duplicates, and loses track of what they have already seen.

02

Tailoring is slow

Each role needs a resume rewritten against its description and shaped to pass an applicant tracking system (ATS), usually by hand.

03

Tools fabricate

Generic AI resume tools inflate keyword scores by inventing employers, metrics, and skills, leaving a document the candidate cannot defend in an interview.

> **The cost is not only time. It is applying to the wrong roles, or sending a resume that does not hold up.**

TARGET USER

Active, mid-career professionals who apply every week.

Primary: the individual job seeker

- Technology professional in India applying to India and India-remote roles, and to roles in the United States
- Already keeps a master resume, often in a Google Doc
- Needs ATS-safe formatting, and will only submit claims they can speak to

Later: teams that run this for many candidates

- Bootcamps and campus placement cells
- Outplacement and career-coaching firms
- Same workflow per candidate, one dashboard for the cohort

PROPOSED SOLUTION

Search, score, tailor, track: one scheduled loop, with a gate that protects cost and truth.

ONCE PER RUN

Daily schedule
Runs only if the user left it on

→

Find roles
LinkedIn query per target role

→

De-duplicate
Then limit, so the cap is spent on new jobs

ONCE PER JOB

Store job
Saved to the board

→

Match score gate
Scored against the master resume. Below the user's bar, it stops here.

→

ATS tailoring
Fixed 8-section contract, validated against the source

→

PDF
LaTeX compile, stored

ONCE PER RUN

Summary email
Every job listed, including those that were gated out

→

Kanban tracking
Discovered to offer; cover letters and interview prep in the same workspace

WHY IT WORKS

Three design decisions make it trustworthy enough to leave running.

1

Match gate before the rewrite

The AI spend goes only to jobs above the candidate's own minimum score. Weak matches stay on the board with their score.

2

Grounded resumes

The prompt and a separate validator agree on one contract. Employers, dates, metrics, and skills must trace to the source resume, or the output is rejected.

3

A real off switch

Pausing the schedule stays paused. Cost and email volume are opt-in, and the candidate reviews every resume before anything is sent.

SOLUTION ARCHITECTURE

Serverless workflow engine: one run per role, one step per job.

CLIENT

- React + Vite SPA
- TanStack Query
- Job kanban
- Copilot chat

BACKEND (RUNNING TODAY)

- Supabase Auth
- PostgreSQL + RLS
- Storage
- Edge Functions

WORKFLOW ENGINE

- Run batches
- Per-job fan-out
- Step queue
- Match gate

GOOGLE AI AND SERVICES

- Gemini API: gemini-3.6-flash (primary + fallback key)
- Google Docs / Drive (master resume, PDF sync)
- Gmail (apply by email)
- Gemini Omni: resume / posting upload (planned)
- Gemini Live: spoken interview practice (planned)
- Vertex AI + Cloud Run (planned)

EXTERNAL DATA AND OUTPUT

- Apify (LinkedIn jobs)
- LaTeX compiler (PDF)
- Resend / email summary

☐ Built and running ⬚ Planned for the buildathon

GOOGLE AI TOOLS AND MODELS

Gemini is the engine today. The buildathon extends it to files and voice.

IN PRODUCTION

Gemini API

Model **gemini-3.6-flash** scores each job against the master resume, rewrites the resume into the ATS contract, drafts cover letters, and writes the interview brief. A second Gemini key is the automatic fallback.

PLANNED

Gemini Omni

Read an uploaded PDF resume or a screenshot of a job posting into the same master-resume corpus, so setup needs no retyping.

PLANNED

Gemini Live

Spoken interview rehearsal on top of the brief the API already writes, with follow-ups drawn from the candidate's real resume.

PLANNED

Google AI Studio

Design and evaluate the prompts for scoring, the ATS contract, cover letters, and interview briefs.

PLANNED

Google Antigravity

Build the scheduled agent steps: search, score, stop or tailor, PDF, summary.

PLANNED

Google Agent Skills

Package each stage as a reusable skill so the loop can be extended per market or per cohort.

BUSINESS MODEL

Freemium for job seekers, per-seat for the teams that serve them.

Free

- Manual search
- Small monthly quota of tailored resumes
- Job board and tracking

Pro (subscription)

- Scheduled daily runs
- More target roles
- ATS review, cover letters, interview prep, apply by email

Usage credits

- Top-up for heavy months
- Each tailored resume is a real model call, so cost tracks usage

Teams

- Per active candidate
- Bootcamps, placement cells, outplacement firms
- Cohort dashboard

Gross margin is protected by design: the match gate keeps the rewrite call for jobs the candidate would actually pursue.

COMPETITION

Others own one step. CareerPilot runs the whole loop, and keeps it honest.

PRODUCT TYPE	EXAMPLES	WHAT THEY STOP AT
Tracker plus tailoring	Teal, Simplify	Candidate triggers each search and rewrite by hand
High-volume auto-apply	LazyApply, Sonara	Optimises number of applications, not whether each is defensible
ATS keyword scoring	Jobscan, Rezi	Scores a resume; does not find jobs or track outcomes
Indian job portals	Naukri, Instahyre	Discovery only; resume work and tracking stay manual
CareerPilot AI	**Discover, score, tailor, PDF, track**	**Scheduled end to end, gated by match score, with output validated against the source resume**

TARGET MARKETS

Start where the founder and first users are. Expand on the same pipeline.

PRIMARY

India

Professionals searching India-based and India-remote roles. Cost-aware users, so the match gate and opt-in defaults matter.

SECONDARY

United States

Already the product's default search location. Followed by the United Kingdom, Canada, and Singapore on the same English-language LinkedIn pipeline.

DEPLOY AND SCALE ON GOOGLE CLOUD

One service per stage, so a long search never sits inside one request.

Compute

- **Cloud Run**: start a run, process one job, copilot
- **Cloud Tasks**: per-job queue, claimed once so retries never double-tailor
- **Cloud Scheduler**: daily tick, active automations only

AI

- **Vertex AI**: Gemini API, Omni, Live under one quota and log project
- **AI Studio** prompts promoted to versioned Vertex prompts

Data and edge

- **Cloud SQL** for PostgreSQL: users, jobs, runs
- **Cloud Storage**: PDFs
- **Secret Manager**: keys
- **Firebase Hosting**: React app

Scaling: Cloud Run and Cloud Tasks fan out per job and scale to zero between runs. A bootcamp cohort is the same services with a higher Vertex quota. The product runs today on Supabase and the Gemini API; this is the migration path.

CareerPilot AI

Apply to the right roles, with a resume you can defend.

Already built and running on Gemini. The buildathon takes it to files, voice, and Google Cloud scale.
